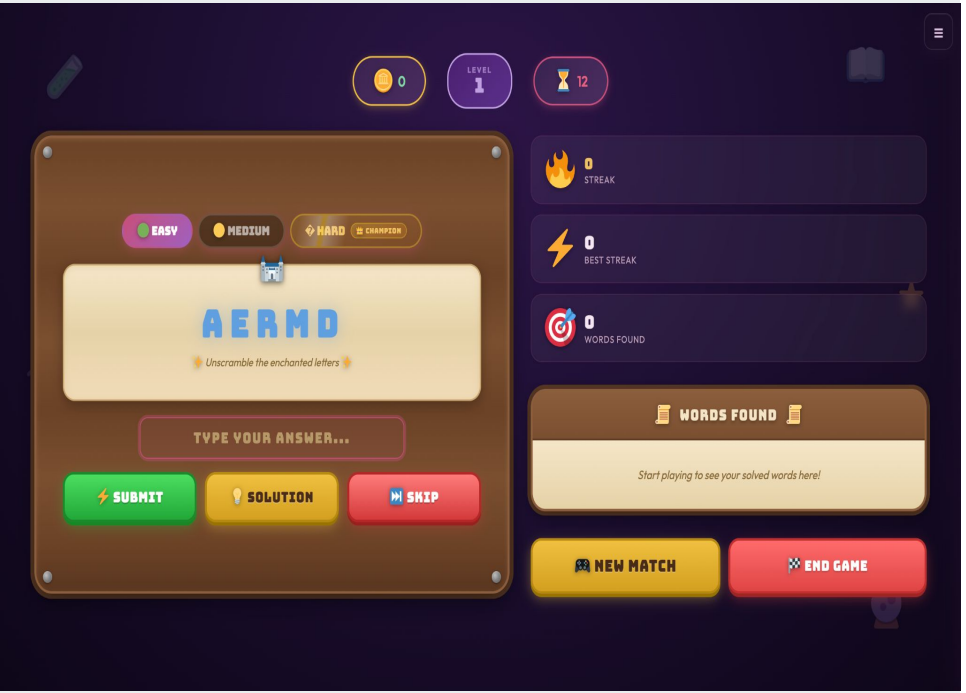
Scramblox: A Web-Based Word Scramble Game

By- Shubh Saraswat

Problem Statement-104

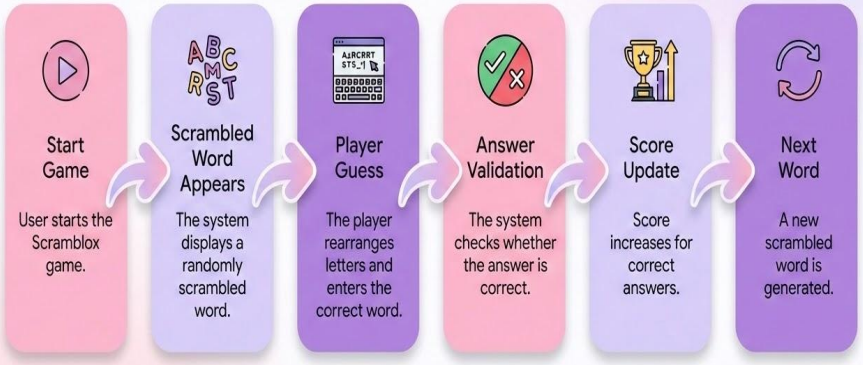
- Many word games focus mainly on entertainment and do not effectively help users improve their vocabulary or thinking skills.
- Users often lack engaging platforms that combine **learning with interactive gameplay**.
- Therefore, there is a need for a **simple and accessible web-based word scramble game** that challenges users to rearrange scrambled words, improve vocabulary, and track their performance in an engaging way.

My Solution



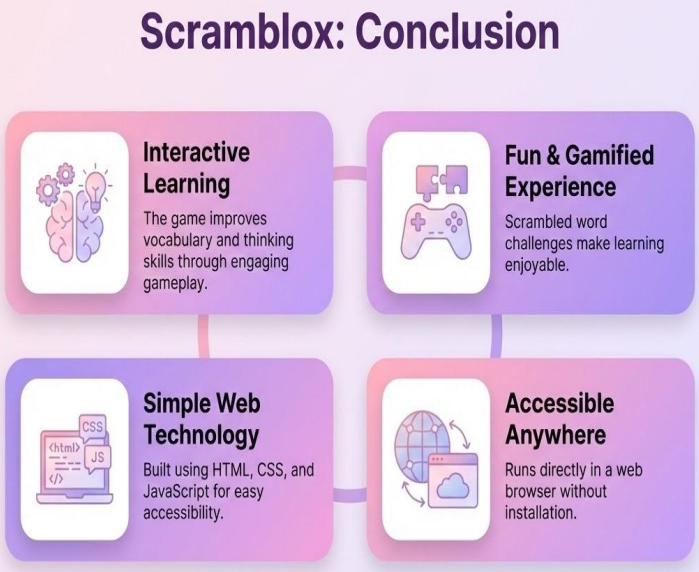
- Develop **Scramblox**, an interactive web-based word scramble game that helps users improve their vocabulary skills.
- The game presents **scrambled words** that players must rearrange correctly within a **time limit**.
- It includes **easy, medium and hard difficulty levels**, scoring, and an engaging user interface.
- The game is built using **HTML, CSS, and JavaScript**, making it lightweight and easily accessible through a web browser.

Working



- The game displays a **scrambled word** to the player.
- The player must **rearrange the letters and enter the correct word** within the given time.
- The system checks the answer and **updates the score accordingly**.
- After each correct answer, a **new scrambled word is generated** based on the selected difficulty level.
- The game continues until the **timer ends**, and the final score is displayed.

Conclusion



- **Scramblox** is an interactive word scramble game designed to improve vocabulary and thinking skills.
- The game makes learning fun through **scrambled words, time-based challenges, and scoring**.
- Built using **HTML, CSS, and JavaScript**, it is lightweight and easily accessible through a web browser.
- The project demonstrates how simple web technologies can create an **engaging and educational gaming experience**.
